Pre-analysis Plans: A Stocktaking *

George K. Ofosu†  Daniel N. Posner‡

October 7, 2019

Abstract

The evidence-based community has championed the public registration of pre-analysis plans (PAPs) as a solution to the problem of research credibility, but without any evidence that PAPs actually bolster the credibility of research. We analyze a representative sample of 195 pre-analysis plans (PAPs) from the American Economic Association (AEA) and Evidence in Governance and Politics (EGAP) registration platforms to assess whether PAPs are sufficiently clear, precise and comprehensive to be able to achieve their objectives of preventing “fishing” and reducing the scope for post-hoc adjustment of research hypotheses. We also analyze a subset of 93 PAPs from projects that have resulted in publicly available papers to ascertain how faithfully they adhere to their pre-registered specifications and hypotheses. We find significant variation in the extent to which PAPs are accomplishing the goals they were designed to achieve.

*The authors thank Maxim Ananyev and Merabi Chkhenkeli for excellent research assistance, and Alex Coppock, Macartan Humphreys, and Matt Lisiecki for valuable comments during the project’s development stage. The authors gratefully acknowledge funding from the Social Science Meta-Analysis and Research Transparency (SSMART) program of the Berkeley Initiative for Transparency in the Social Science (BITSS). The survey of researchers who register pre-analysis plans, which provides some of the data reported in the paper, was determined to be exempt from IRB review (UCLA IRB # 19-000063).

1 Introduction

Pre-analysis plans (PAPs), public documents that specify in advance the hypotheses a researcher will investigate and how the data will be analyzed, have been championed as an important tool for addressing the problem of research credibility in the social sciences (Ioannidis, 2005; Franco, Malhotra and Simonovits, 2014; Simonsohn, Nelson and Simmons, 2014; Open Science Collaboration, 2015; Christensen, Freese and Miguel, 2019). Their use has skyrocketed in recent years. As shown in Figure 1, the number of PAPs registered on the American Economic Association (AEA) and Evidence in Governance and Politics (EGAP) registries has grown exponentially over the past seven years. Graduate students are now taught that registering a PAP is a de rigueur part of undertaking their research projects.

Figure 1: PAP registrations on the AEA and EGAP registries, 2011-2018

PAPs are advocated for two main reasons. First, they prevent “fishing.” Fishing is the practice of selectively reporting, from among the many possible results that might be generated from a given set of data, the subset of findings that are statistically significant, novel, or allow the researcher to tell a cleaner story.  

PAPs are a special case of pre-registration, which involves publicly declaring one’s intention to undertake a study that investigates a particular hypothesis. PAPs go beyond pre-registration by also providing details of how the proposed analysis is to be undertaken.

---

1PAPs are a special case of pre-registration, which involves publicly declaring one’s intention to undertake a study that investigates a particular hypothesis. PAPs go beyond pre-registration by also providing details of how the proposed analysis is to be undertaken.
or more compelling story. PAPs solve this problem by specifying in advance exactly which econometric specifications, outcome variables, coding rules, covariates, sub-samples, and inclusion rules will be used to generate the results that will be presented as the definitive test of the research question. Specifying the key details of the analysis in advance reduces the “researcher degrees of freedom” that provide latitude for consciously or unconsciously selecting particular specifications that make the results more striking.

Second, PAPs prevent hypothesizing after results are known (sometimes abbreviated as “HARKing”). HARKing involves interpreting results ex post based on the results of the analysis rather than ex ante based on expectations derived from theory. PAPs solve this problem by specifying in advance which hypotheses a researcher is intending to test, thus preventing the researcher from succumbing to hindsight bias and engaging in postdiction (Nosek et al., 2018). Registering research hypotheses in advance in a PAP need not prevent researchers from using their data to conduct exploratory research. Pre-registration simply clarifies which of the analyses the researcher ultimately presents in the paper are confirmatory (i.e., testing predictive hypotheses specified before the results were known) and which should be treated as exploratory (i.e., products of learning and new hypothesis generation based on the patterns that emerged in the data). Both confirmatory and exploratory findings can be sources of insight, but the evidentiary status of each is quite different.

These two benefits of PAPs are clear and, for those committed to improving the credibility of social science research, compelling. But whether PAPs are actually achieving these goals in practice is an empirical question—albeit an extremely challenging one to answer definitively. One cannot compare the degree of fishing and post-hoc hypothesis adjustment in studies implemented with and without PAPs because, absent a PAP, there is no record of the analyses or hypotheses that were pre-specified. And even if such a comparison were possible, the conclusions one could draw would be undermined by the fact that researchers self-select into whether or not they pre-register their analyses, and the researchers who file PAPs are quite likely different from those who do not. Moreover, even researchers who regularly file

---

2 For an illuminating illustration of the scope for fishing within a real study, see Casey, Glennerster and Miguel (2012).
3 For a discussion of researcher degrees of freedom, see Simmons, Nelson and Simonsohn (2011) and Wicherts et al. (2016). For discussions of the incentives researchers have to generate more striking results, see Nosek et al. (2018) and Laitin and Reich (2017).
4 As Nosek et al. (2018) emphasizes, “Preregistration does not favor prediction over postdiction; its purpose is to make clear which is which.”
5 For a notable attempt to estimate the causal effect of registration in the medical field, see Fang, Gordon and Humphreys (2015).
PAPs do not register them for all of their studies, so the lack of randomness in who pre-registers a PAP is compounded by within-researcher selection across projects.\textsuperscript{6}

We therefore adopt a different approach. We draw a representative sample of PAPs and analyze their content to determine whether they are sufficiently clear, precise, and comprehensive as to meaningfully limit the scope for fishing and post-hoc hypothesis adjustment. We also assess whether PAPs do, in fact, tie researchers hands by comparing publicly available papers that report the findings of pre-registered studies to the PAPs that were registered when those studies were initiated. These are, of course, subjective judgements. But we have undertaken, in our coding rules and our procedures, to be both transparent and objective in the judgements we make. We also underscore that none of our findings should be taken as evidence of the causal effects of pre-registration. Notwithstanding these unavoidable weaknesses, we believe that our analysis can provide an illuminating assessment of whether PAPs, as they are actually written and used, are able to accomplish the main objectives that have motivated their widespread promotion and adoption.\textsuperscript{7}

The importance of such an assessment is rooted in the significant costs associated with writing and following a PAP (Olken, 2015; Coffman and Niederle, 2015; van’t Veer and Giner-Sorolla, 2016). The modal researcher in our PAP users’ survey (discussed below) reports spending 2-4 weeks preparing her pre-registration materials, and more than a quarter of researchers report spending more than a month. Beyond the time they take to write, the hand-tying in PAPs is claimed to limit the scope for breakthroughs that come from unexpected, surprise findings. PAPs are also said to force researchers to undertake analyses that they know to be inappropriate or sub-optimal once they have encountered their data. Other critics point out that, whatever the benefits of pre-registration may be in theory, PAPs are unlikely to enhance research credibility without vigorous policing—something the disciplines generally do not reward (Laitin, 2013; Laitin and Reich, 2017). Still others argue that publicly posting the details of one’s proposed analyses is an invitation for plagiarism. This is especially a concern for junior scholars and other researchers who may lack the resources to quickly implement a promising research design.

While there are good responses to many of these objections (many of which we discuss below), they

\textsuperscript{6}In our PAP users’ survey (discussed below) 78\% of researchers said they had at least one ongoing research project for which they did not register a PAP.

\textsuperscript{7}An analogous stocktaking, involving the comparison of published and unpublished papers with the proposals that secured their funding, is provided in Franco, Malhotra and Simonovits (2014).
nonetheless underscore the importance of assessing how much weight should be put on the positive side of the ledger. Doing so requires taking the stocktaking exercise we undertake here.

2 Methods

2.1 Sampling

To evaluate whether PAPs are written sufficiently clearly and comprehensively to achieve their intended objectives, we drew a representative sample of PAPs from the universe of studies registered on the AEA and EGAP registries between their initiation and 2016.\(^8\) Because we were interested not just in the PAPs’ contents but also in how those contents shaped the reporting of the research that was undertaken, we drew our sample so that roughly half of the PAPs would be from studies that had resulted in publicly available papers (journal articles or working papers).

Our procedures, described in detail in Appendix A, yielded a sample of 204 PAPs, equally distributed between those with and without publicly available papers. Unfortunately, in nine instances, working papers that had been found on authors’ websites at the time we included the PAPs in our sample were no longer publicly available by the time we began our coding. We therefore coded only 93 PAPs with papers, bringing our final sample of coded PAPs to 195.

2.2 Coding

All 195 PAPs in our sample were coded according to a common rubric that recorded details of the hypotheses that were pre-specified, the dependent and independent variables that would be used in the analysis, the sampling strategy, the inclusion and exclusion rules, and the statistical models to be run, among other features. For the sub-sample of 93 PAPs for which publicly available papers were available, we added further questions that addressed how faithfully the pre-specifed details of the analysis were adhered to in the resulting paper. The complete coding rubric for PAPs with papers is provided in Appendix B. All PAPs were coded by at least two different people—a research assistant and one of this paper’s authors—and any discrepancies between them were investigated and recoded.

\(^8\) Although the web forms that investigators complete when registering their studies on both of these sites provide opportunities for describing many details of the proposed research, including much of the information that ordinarily goes into a formal PAP, our analysis only includes studies for which a formal PAP was uploaded.
Although much of the information collected in the coding rubric was straightforward and unambiguous—for example, whether the PAP was registered prior to data collection; whether the PAP included a power analysis, committed to a multiple testing adjustment, or was ever gated or private—a number of the key coding items involved subjective judgements. Chief among these was whether the main research hypotheses and the key causal and outcome variables were specified sufficiently clearly as to prevent post-hoc adjustments. For the latter, our coding rules asked the coder to consider, following Olken (2015), whether “if you gave the PAP to two different programmers and asked each to prepare the data for the primary dependent/independent variable(s), they [would] both be able to do so without asking any questions, and they [would] both be able to get the same answer.” As for the clarity of the research hypotheses, we defined a “clear hypothesis” as one that describes a relationship between an independent and dependent variable in which the direction of the effect is specified.

In the discussion that follows, we occasionally draw on examples from the PAPs we analyzed to illustrate our points. When we do so, we change the details to protect the anonymity of the PAP authors. This is in keeping with our goal of identifying broad patterns in how PAPs are written and used, not singling out particular authors for particularly weak (or strong) practices.

2.3 Survey of PAP users

We supplemented our coding of PAPs with an anonymous survey of PAP users to elicit their experiences with writing and using PAPs in their research. We were especially interested in collecting information about how the practice of composing and registering a PAP had changed the ways in which the investigators went about their work. The survey (reproduced in full in Appendix C) was sent to all affiliated researchers in the EGAP and Innovations for Poverty Action (IPA) research networks (N=664). We received 155 responses, of which 81% reported having registered a PAP for at least one project and 60% reported having registered multiple PAPs.

3 Are PAPs achieving their objectives?

Before turning to our findings, it will be useful to say something about the sample of PAPs on which our stocktaking is based. The overwhelming majority of the 195 PAPs we coded were from field (63%)}
survey (27%), or lab (4%) experiments; observational studies comprised just 4% of our sample. Eighty-one percent of PAPs were registered on the AEA or EGAP websites prior to data collection, and another 19% were registered after data collection but before the researchers had access to their data or began their analysis. In keeping with their share in the population of PAPs registered on the AEA and EGAP registries during the period we studied, 50% of the PAPs we coded were originally gated or private and 45% were registered in 2016. The fact that such a large share of our sample comes from the final year of our analysis speaks to the exponential growth in the registration of PAPs over the period we studied. It also (somewhat) allays concerns that the findings we present come from the early period of PAP usage, when researchers were still just learning how to use PAPs as tools in their research.

3.1 Do PAPs reduce the scope for fishing?

Fishing is made possible by imprecise variable definitions and by lack of clarity about the statistical models that will be run, the covariates that will be included, and the rules that will be applied for excluding cases, among other details of the analysis that will be undertaken. The failure to clearly specify these aspects of the research design in advance provides scope for researchers to run their analyses multiple ways and then present as their “test” of the hypothesis in question the specification that happens to generate the most appealing results. This can happen either nefariously (by researchers searching for findings that they think are more likely to be published or bring them renown) or inadvertently via post-hoc rationalization (“Of course this was the right specification to run! Silly of me not to have seen this at the outset!”)—a skill at which human beings are dangerously accomplished (Nosek et al., 2018). Whatever the source, fishing undermines the credibility of the research findings.

One of the key features we coded in our sample of PAPs was whether the primary dependent and independent/treatment variables were operationalized sufficiently clearly as to prevent post-hoc adjustments. Examples of lack of clarity include defining the outcome of interest as “political participation” without specifying how political participation is to be measured; hypothesizing that the partisan align-

---

9 Tellingly, among the 77% of researchers in our PAP users’ survey who reported having other projects for which they did not register a PAP, the most commonly cited reason was because they were observational studies.

10 In the PAP users’ survey, several researchers said they hesitated to register PAPs for studies drawing on data that was, in principle, available to them prior to drafting the PAP, as there was no way to prove that they had not looked at the data. This may account for the lower share of studies registered after data collection had commenced.
ment of a radio station will matter for the impact of the messages it broadcasts, with partisan alignment
determined through “content analysis of programming;” or promising to “create an index” without spec-
ifying exactly how the index is to be constructed. None of these examples would pass the Olken test
described above. Yet these violations are relatively rare. In our sample of PAPs, 77% of primary depen-
dent variables and 93% of independent/treatment variables were judged to have been clearly specified.11

PAP authors were less good, however, at clearly specifying their control variables. Many PAPs
indicated the researchers’ intentions to “include baseline controls to improve precision” or to control for
imprecisely defined covariates such as “wealth,” “demographic characteristics,” “employment status,” or
“cognitive ability.” While these variables may well be relevant to include, describing them in the PAP
in such broad and non-specific terms leaves wide scope for fishing at the data analysis stage.12 Lack of
clarity in variable definition is not the only issue. In 44% of PAPs, the number of pre-specified control
variables was judged to be unclear, making it nearly impossible to compare what was pre-registered with
what is ultimately presented in the resulting paper.

Further scope for fishing comes from imprecision in the empirical models that are pre-specified.
Insofar as researchers can generate different results if they run their analyses using ordinary least squares,
weighted least squares, multinomial logit, or other approaches—not to mention with or without particular
adjustments for calculating standard errors—it is critical to commit in advance to a particular statistical
model. Yet only 68% of PAPs were judged to have spelled out the precise statistical model to be tested
and just 37% specified how they would estimate their standard errors. In 19% of cases, the models
presented in the resulting papers deviated from the models specified in the PAP—for example, two stage
least squares was run when ordinary least squares was pre-specified; controls were added or omitted;
covariate adjustment was specified in the PAP but not undertaken in the paper. Such deviations are not
a problem if they are noted and a rationale is provided for the divergence from what was pre-registered.
However, in the fourteen instances in our sample where deviations occurred, the change was noted in
only one case.

11 The high rate of clearly specified main independent variables stems from the fact that in most cases—90% in our
sample—this variable is simply a treatment dummy whose details are unambiguous.
12 Even when attempts are made to clarify how such variables are to be measured, the clarifications are often equally
problematic. For example, defining “wealth” as an index based on characteristics such as the condition of a respondent’s
dwelling, a household’s ownership of animals, agricultural equipment, and other assets, or the number of days a household
goes without food still leaves broad latitude for subjectivity and fails the Olken test.
Additional latitude for specification searching comes from lack of clarity about the rules that researchers will apply to include or exclude units from their analyses and, in experimental work, to deal with unanticipated imbalances across treatment and control groups. Such rules are important because unforeseen implementation challenges—attrition, noncompliance, project delays, problems with randomization—often force researchers to make fixes at the analysis stage that can bias the results, intentionally or unintentionally, toward a particular conclusion. It is therefore noteworthy that just 25% of PAPs specified how they would deal with missing values and/or attrition; just 13% specified how they would deal with noncompliance; just 8% specified how they would deal with outliers; and just 20% specified how they would deal with covariate imbalances. While all of the studies for which such rules were pre-specified followed them in the resulting papers, the fact that so many PAPs were silent on these issues underscores the incompleteness of most PAPs—and the opportunities that such omissions provide for researchers to tweak their analyses in ways that generate particular results.

The practical difficulties with pre-specifying responses to every possible implementation problem that might arise has led to the development of standard operating procedures (SOPs)—a set of default practices adopted by a lab or research group to which study authors can commit in advance to guide decisions that are not addressed specifically in the PAP (Lin and Green, 2016). However, notwithstanding the utility (and time savings) that might come from invoking SOPs, just 3% of the PAPs in our sample indicated that they would rely on SOPs to deal with unanticipated deviations from their pre-registered designs.

3.2 Do PAPs reduce the scope for post-hoc hypothesis adjustment?

The clearest strategy for eliminating the scope for post-hoc hypothesis adjustment is to specify the hypotheses in a way that leaves no ambiguity about the propositions that the research will test. In this respect, PAP authors do quite well. Ninety percent of the PAPs we coded were judged to have specified a clear hypothesis.

However, even clearly specified hypotheses can leave scope for HARKing if authors pre-specify so many hypotheses that they can pick and choose which ones to report after they have seen their results. In this respect, PAP authors fared less well. While 34% of PAPs specified between one and
five hypotheses—a number sufficiently small as to limit the leeway for selective presentation of results downstream—18% specified between six and ten hypotheses; 18% specified between 11 and 20 hypotheses; 21% specified between 21 and 50 hypotheses; and 8% specified more than 50 hypotheses (see Panel A of Figure 2). PAPs that pre-specify so many hypotheses raise questions about the value of pre-registration.13

Figure 2: Number of pre-specified hypotheses

Figure 2 shows the distribution of the number of hypotheses pre-specified in the full sample of PAPs (Panel A) and the number of primary hypotheses pre-specified in the subset of PAPs that pre-specified more than 5 hypotheses in all and that distinguished between primary and secondary hypotheses (Panel B).

One safeguard against this pitfall is to distinguish between primary and secondary hypotheses. Many PAPs adopt this protection: among authors who pre-specified more than five hypotheses, 60% make such a distinction. But they often do so in ways that do little to solve the underlying problem. As shown in Panel B of Figure 2, only 42% of PAPs that distinguished between primary and secondary hypotheses limited the number of primary hypotheses they specified to five or fewer. Twenty-six percent pre-specified 6-10 primary hypotheses; 12% pre-specified 11-20; 17% pre-specified 21-50; and 3% pre-specified more than 50. From the standpoint of reducing the scope for selective presentation of results...

13Closely related to the number of hypotheses is the length of many PAPs. While the median PAP in our sample was 11 single-spaced pages, the longest 10 percent were more than 31 pages, and three were over 90 pages long.
search findings, distinguishing between primary and secondary hypotheses is only useful if the number of primary hypotheses is kept small.

Another safeguard is to pre-commit to a multiple testing adjustment. Multiple testing adjustments down-weight the statistical significance of any single result based on the number of hypotheses that are being tested, thus guarding against the cherry-picking results in instances where there are many possible findings to choose from. Yet among the PAPs in our sample that pre-specified more than five hypotheses, just 28% pre-committed to a multiple testing adjustment.

Taken together, these practices leave significant leeway for authors to omit results that are null or that complicate the story they wish to tell. But do authors take advantage of this latitude in practice? To find out, we examined the sub-sample of 93 PAPs we coded that had publicly available papers and compared the primary hypotheses pre-specified in the PAP with the hypotheses discussed in the paper and/or its appendices. We find that study authors faithfully presented the results of all their pre-registered primary hypotheses in their paper or its appendices in just 61% of cases. More than a third of studies had at least one pre-registered hypotheses that was never reported. Taking primary and secondary hypotheses together, the median paper in our sample neglected to report 25% of the hypotheses that had been pre-specified in the PAP. To be sure, constraints on journal space and the desire to package a study’s results in a more readable form, rather than unscrupulous research practice, likely accounts for many of the omitted hypotheses. But the frequency of the mismatch between what is pre-registered and what is presented undermines research credibility.

Apart from pre-registering hypotheses that are not reported in the paper, authors may also deviate from the PAP by reporting the results of hypotheses that were not pre-registered at all. We found that 18% of the papers in our sample presented tests of novel hypotheses that were not pre-registered. Such deviations need not be a problem for research credibility if authors are transparent about the fact that the hypotheses were generated after the PAP was filed. But authors that presented results based on hypotheses that were not pre-registered failed to mention this in 82% of cases.
3.3 Other issues

3.3.1 Solving the “file drawer problem”

Beyond reducing the scope for fishing and post-hoc hypothesis adjustment, PAPs can help address the “file drawer problem.” The file drawer problem refers to the bias in the received wisdom, as reflected in the published literature on a given topic, by the tendency for authors not to submit, reviewers not to support, and/or journals not to publish results that fail to reach conventional thresholds for statistical significance (Rosenthal, 1979; Gerber and Malhotra, 2008; Franco, Malhotra and Simonovits, 2014). PAPs contribute to solving this problem by providing a public record of the population of studies that were initiated, even if they were never published (perhaps because they generated null results). Such a record acts as a safeguard against being misled about the prior findings on a given topic by having access only to the (biased) sample of studies that happened to generate significant findings and that therefore made it into the public domain. We should be clear: filing a PAP is not, strictly speaking, necessary to address the file drawer problem. Pre-registration, which involves simply publicly declaring one’s intention to undertake a study that investigates a particular hypothesis, should be sufficient. However, pre-registering a PAP does this and more, so it makes sense to include the contribution to solving the file drawer problem in a discussion of the benefits of PAPs.

Whether PAPs aid in addressing this problem, however, depends on whether researchers actually consult registries to learn whether investigations that have not been published may have been undertaken on a given topic. We asked researchers about this in our PAP users’ survey and just 38% reported that they had ever consulted a registry for this purpose. Like a tree falling in the forest with nobody nearby to hear it, PAPs—and pre-registration more generally—will do little to reduce the file drawer problem if researchers do not take advantage of the public record they provide about what has been done.

An argument is also made that registering a PAP can put researchers in a stronger position to publish the results of their studies, even if they generate null effects. Indeed, several journals in Political Science and Economics have begun experimenting with soliciting “registered reports” in which authors submit PAPs in lieu of finished research papers. Editors and reviewers then evaluate these submissions based on the importance of the questions that motivate the research and the quality of the proposed

---

14 This is why the AEA registry encourages pre-registration even in the absence of a formal PAP.
designs, with strong submissions accepted in principle on the condition that the data is collected and analyzed as proposed. One such experiment in Political Science, a 2016 special issue of *Comparative Political Studies*, generated mixed reviews. Study authors generally liked the results-free submission and review process (Bush et al., 2018) but the editors concluded that the costs outweighed the potential benefits and indicated that they would not be moving toward a registered reports model for the journal writ large (Ansell and Samuels, 2016; Findley et al., 2016).

### 3.3.2 Protecting against research partners with rival interests

Another leading rationale for PAPs is that they can help protect researchers against partners with rival interests. Donors and governments are frequently the funders of the research activities for which PAPs are written, and, like pharmaceutical companies who underwrite research in the medical sciences, these actors may have interests in having the research generate particular conclusions. By providing an opportunity to discuss and agree in advance on both the results that will be reported and the specifications that will be employed to generate them, PAPs can help protect against pressure from such partners to favor particular empirical approaches or findings once the data analysis has begun and the results are becoming clear. Although most researchers in our PAP users’ survey indicated that they had not yet used a PAP to protect themselves against a research partner with rival interests, several indicated that they had, and others indicated that they imagined that a PAP could be useful for this purpose.

### 4 Objections to PAPs

Our stocktaking exercise was motivated by a desire to assess the extent to which PAPs, as they are actually written and used, are able to address the research credibility problems for which they have

---

\(^{15}\) Journals in Psychology and the medical sciences have long run their submission processes in this manner. In Political Science and Economics, journals that embraced results-free submissions include the *Journal of Experimental Political Science, Research and Politics*, the *Journal of Development Economics* and the *Japanese Journal of Political Science*. A longer list of journals have experimented with special issues that solicited registered reports, even if they have not (yet) adopted the approach as a regular submission option. A full list is available at https://osf.io/8mpji/wiki/home/.
been promoted as solutions. However, our assessment also puts us in a position to address some of the objections to PAPs that have been raised in the literature.¹⁶

### 4.1 Too time consuming

Foremost among the objections to PAPs is that they are too time-consuming to prepare. Eighty-eight percent of researchers in our PAP users’ survey reported devoting a week or more to writing the PAP for a typical project, with 32% reporting spending an average of 2-4 weeks and 26% reporting spending more than a month. It is perhaps not surprising, then, that 34% of researchers said that writing a PAP delayed their studies’ implementation.

However, while the PAP users we surveyed nearly all agreed that writing a PAP was costly, 64% agreed with the statement that “it takes a considerable amount of time, but it is worth it.”¹⁷ An overwhelming majority (8 in 10) said that drafting a PAP caused them to discover things about their project that led to refinements in their research protocols and/or data analysis plans. Sixty-five percent said that it put them in a position to receive useful feedback on their project design that they otherwise would not have received. And 52% said that they experienced downstream time savings from having written a PAP, with 64% indicating that these savings were equal to or greater than the time spent to draft the PAP in the first place. PAPs thus appear to shift the timing of work on research projects—from the back end, when the analysis is done, the results are written up, and most of the careful thinking about the project has traditionally taken place, to the front end. But it is not clear that, on net, PAPs generate significantly more work.

### 4.2 Limit scope for new discoveries

Another major critique of PAPs is that, by tying researchers’ hands, they limit the scope for new discoveries that come from unconstrained explorations of one’s data. One researcher in our PAP users’ survey faulted PAPs for forcing her/him to “think about the lowest risk research I can run with the least potential

¹⁶Useful discussions of objections to PAPs that go beyond the ones discussed here—and that echo several of the challenges articulated by respondents in our PAP users’ survey—are provided in Humphreys, De la Sierra and Van der Windt (2013); Olken (2015); van’t Veer and Giner-Sorolla (2016); and Nosek et al. (2018).

¹⁷Just 6% said: “it doesn’t take much time, so the cost is low.” Thirty percent said: “it takes a considerable amount of time, and I am not certain of the value in the end.”
for surprising findings.” Another described PAPs as “stifling creativity” and worried that they “are being used as ammunition against careful researchers with integrity who genuinely want to learn from data.” Yet these appear to be outlier views. Only 11% of researchers said they thought that the existence of a PAP restricted their ability “quite a bit” to fully explore and analyze their data, whereas 43% reported feeling not at all constrained.\textsuperscript{18} Similarly, only 15% said they thought that having registered a PAP prevented them “quite a bit” from stumbling on unexpected, surprise results.\textsuperscript{19} Indeed, in response to a question about how they have dealt in their research papers with deviations from what they pre-registered in their PAPs, researchers describe simply labeling results as not pre-specified and explaining why they were added to the analysis.

A related concern is that fidelity to PAPs—combined with the faithful marking of results in the paper as either pre-registered or exploratory—leads to boring papers that are disadvantaged in the review process. “Editors want a good story,” one PAP user lamented, “and the PAP nearly never delivers a good read—it only delivers a boring, mechanical read with no surprises or new insights.” Another researcher suggested that “papers without a strong coherent narrative are customarily rejected by journals, and a PAP nearly never produces a strong narrative.” Another echoed this point, noting that “I almost always deviate from the PAP in order to make a paper that makes sense.” Again, these views are far from universal. In response to a question asking whether the existence of a PAP made it more difficult to write a theoretically interesting paper, 49% of respondents said “not at all.” Just 12% said they thought the existence of a PAP increased “quite a bit” the difficulty of writing a theoretically interesting paper.

4.3 Policing

By providing a record of the hypotheses a researcher intends to investigate and the analyses she commits herself to employ to test them, a PAP makes it possible for deviations from these pre-specified plans to be identified—but only if reviewers, editors, and/or consumers of the published work invest the considerable time and energy to track down the PAP and compare it (and, sometimes, its several iterations) side-by-

\textsuperscript{18}Forty-six percent reported feeling somewhat constrained in their ability to fully explore their data.
\textsuperscript{19}Thirty-seven percent reported that the existence of a PAP had not at all prevented them from stumbling on unexpected results, whereas 48% reported being somewhat prevented.
side with the working paper or published article.\textsuperscript{20} Laitin (2013) makes the point strongly: “registration without a community of scholars interested and incentivized to challenge findings is worthless.”

Is there any evidence that such policing actually happens? We asked the researchers in our PAP users’ survey whether, when they had submitted a paper with pre-registered analyses for review at a journal, reviewers had ever mentioned their PAP. Just 39\% reported that reviewers had.\textsuperscript{21} A similarly small share said that other researchers had invoked their PAP when discussing their paper outside of the formal review process (35\%), or that they themselves had consulted the PAP of a paper they were reviewing (34\%). While PAPs may make policing possible, the norms and practices among reviewers, journal editors, and seminar participants seem not to have yet evolved to generate the strong policing equilibrium that would be required for PAPs to play the hand-tying role that they were designed to play.\textsuperscript{22}

There is also a sentiment, in some parts of the PAP users’ community, that PAPs offer the worst of both worlds, in the sense that they tie researchers’ hands, preventing them from investigating interesting threads that emerge in their analysis, while still leaving them open to demands from reviewers for endless robustness tests. As one PAP user wrote: “I’ve gotten an absurd number of requests for sensitivity analyses for strictly pre-specified empirical work. The existing norm appears to keep me from looking for unexpected results while providing no protection from readers or reviewers who want to dig through the data trying to kill off empirical results they don’t agree with.” Although 46\% of PAP users report having invoked their PAP to respond to the suggestions of reviewers or workshop participants regarding additional analyses to run, one lamented that pointing to the PAP does little good, since “referees and editors ignore them/refuse to be bound by them.” Again, the absence of common norms about what PAPs obligate both producers and consumers of research to do leaves pre-registration well short of achieving its goals.

\textsuperscript{20} As we have learned in our coding work for this project, this is challenging, time-consuming work
\textsuperscript{21} This relatively how share may reflect the fact that only 28\% of PAP users said that had ever included their PAP with the paper when they submitted it to a journal (however, another 50\% said that this was because the paper mentioned the PAP and they assumed that reviewers could easily find it).
\textsuperscript{22} An insightful discussion of policing norms in Political Science, and the challenges of changing them, is provided in Laitin and Reich (2017).
4.4 Getting scooped

We also asked researchers in our PAP users’ survey whether, in contemplating registering a PAP, they had any concern that others might scoop their ideas. Forty-six percent reported having no concern whatsoever, with another 39% saying they had slight concern. Eleven percent said that they were unconcerned because the PAP was gated or private. If we assume that preventing others from stealing their ideas was the only reason why these researchers gated their PAPs, then the total share of researchers expressing significant concern about getting scooped is below 15%.

5 The balance sheet

Our stocktaking suggests that PAPs, as they are currently written and used, are not doing everything their proponents had hoped for. Many PAP authors are insufficiently clear about the hypotheses they are testing to prevent them from moving the goal posts once they have seen the patterns in their data. The details of the analyses that PAPs pre-specify—how outcome and causal variables are to be operationalized; which controls will be included; what the statistical model will look like; how imbalances, outliers, and attrition will be dealt with—are often inadequate to reduce researcher degrees of freedom in a meaningful way. In addition, papers that result from pre-registered analyses do not always follow them. Some papers introduce entirely novel hypotheses; others present only a subset of the hypotheses that were pre-registered. These deficiencies raise questions about the utility of PAPs in promoting more credible research.

However, while many of the PAPs we analyzed fell short of the ideal, a majority were sufficiently clear, precise and comprehensive to substantially limit the scope for fishing and post-hoc hypothesis adjustment. So, even if improvements in research credibility do not come from every PAP, the growing adoption of PAPs in Political Science and Economics has almost certainly increased the number of credible studies in these fields.

As PAP skeptics point out, however, these benefits come at a cost. While many of the costs of writing and adhering to PAPs are real, our data suggest that PAPs do not restrict researchers’ investigations or gum up the research process nearly as much as their detractors claim. On balance, researchers
report that, while writing a PAP is costly, the benefits outweigh the costs. For every researcher who describes PAPs as “an additional hassle” or “toxic to the process of doing research” there is another who says that writing a PAP “makes me more thoughtful and deliberate” or “causes me to really think through design and analysis decisions that, honestly, were often done on the back end.”

Our sense is that, alongside improving the standards for what PAPs should include, the biggest issue going forward is the development of norms about how PAPs should be used by the research community. Laitin articulates the issue well when he writes that “all the pre-analysis plans...we produce do not serve science if no one has a career interest in deciphering them or confirming the results that followed from them. We have increased the supply of transparency but have given insufficient attention to generating a demand for it” (Laitin, 2018).

Appendix

A Sampling procedures

As shown in Figure A.1, a total of 1,671 studies were registered on the AEA (1,235) and EGAP (436) registries during the period we studied. Of these, 591 had PAPs (269 of the AEA-registered studies and 322 of the EGAP-registered studies). The next step was to identify whether each study had resulted in a publicly available paper. To do this, we conducted web searches of each study author’s web page, as well as key-word searches based on the project’s title and abstract. Of the 591 studies with PAPs, we found 235 that had resulted in a publicly available paper by the time of our search.

Figure A.1: Sampling Procedure

Is the study registered

No (N=???)

Yes (N=1,671)

Does the study have a PAP?

No (N=1,080)

Yes (N=591)

Is there a publicly available paper?

No (N=356)

Draw stratified random sample of 100 studies

Yes (N=235)

Draw stratified random sample of 100 studies

Notes: Stratification is by year, initially gated status, and study registry (AEA and EGAP).

We then drew a random sample of 100 of these studies, alongside a random sample of 100 studies that had not yet resulted in a publicly available paper. In drawing these samples, we stratified by three criteria: the year the study was registered (2011, 2012, 2013, 2014, 2015, 2016), whether the study was registered on the AEA or EGAP registries, and whether or not the PAP was initially gated/private.

---

23 In addition to the 1,671 registered studies there are, of course, also an unknown number of studies that are not registered at all, and that therefore fall outside the scope of our analysis. We underscore that the absence of these studies in our sample prevents us from making causal claims about the effects of PAPs.

24 The reason for the smaller share of studies with PAPs on the AEA registry is because many of the projects registered there were included to provide a record of the fact that they had been undertaken rather than to pre-register a set of research procedures or hypothesis. To avoid including PAPs written by graduate students as part of a class exercise, we limit our analysis to PAPs written by researchers holding an academic appointment or, if not at an academic institution (i.e., at the World Bank), then holding a PhD.
The fact that not all PAPs are made public at the time a study is registered created a challenge for our coding exercise. The AEA registry affords study authors the opportunity to keep their PAPs private and the EGAP registry, while strongly discouraging researchers from doing so, permits study authors to gate their PAP for a period of time. As shown in Figure 2, of the 591 studies with PAPs, 304 were initially private/gate, although 101 of those had become public/ungated by the time we drew our sample in March 2018.

Figure A.2: Dealing with private/gated pre-analysis plans

Is the study private/gate?

Initially Yes (N=304)
   Yes as of March 2018 (N=203)

Initially No (N=287)
   No as of March 2018 (N=388)

Do author(s) respond to inquiry about PAP?

No (N=35)

Yes (N=75)
   Do author share PAP with us?

No (N=11)

Yes (N=64)

Notes: We contacted the authors of 123 studies and can confirm 110 read our email.

To reach our goal of coding 100 PAPs from projects that had resulted in publicly available papers and another set of 100 that had not, and anticipating that some scholars might not share their private/gated PAPs, we oversampled 30 percent of gated plans in each category. The oversample contained 265 PAPs (132 with papers and 133 without), of which 123 were still private/gated as of March, 2018. We contacted the authors of these private/gated PAPs via email to ask them to confidentially share their PAPs with us. Of the 120 authors who we can confirm received and read our email, we received replies from 75 (68 percent), of which 64 (58 percent) were willing to share their PAP. Summary statistics are provided in Appendix A.2.

---

25Our suspicion is that the kinds of authors who keep their PAPs private or who gate them for an initial period may be different from those who make them public from the start. Hence our decision to stratify our sample by this criterion.

26A copy of the email, which was sent on April 10, 2018, is provided in Appendix A.1. We sent a reminder email nine days later to authors who had not yet responded.

27Of the 11 study authors who replied to our query but did not share their PAP, five reported that their study was still ongoing and one reported that the study was cancelled. Others reported that there was no PAP (even though the registration suggested there was one) or insisted that they had made the PAP public, even though we were not able to access it.
A.1 Email to authors of private/gated PAPs

Dear Author (Dr. XXX),

As part of an ongoing research project on pre-registration and research transparency in the social sciences, we are collecting pre-analysis plans of studies that have been pre-registered on the AEA (socialscienceregistry.org) and EGAP (egap.org) registries. We see that your study, “[study title]” (registration # “[registration number]”) is currently private (or gated), which means that we are unable to view your pre-analysis plan.

We are writing to ask if you would be willing to share your pre-analysis plan with us. We pledge not to share it publicly and to use it only for our analysis.

We would very much appreciate receiving your response within the next two weeks. You can send your pre-analysis plan to us as an attachment to PAPstudy2018@gmail.com.

Thank for your help in advance.

Best regards,

George Ofosu, Washington University, St. Louis
Daniel Posner, UCLA

B Coding rubric for PAPs with papers
Coding Instrument for PAPs with Papers

Coding Instrument

Study identification

1. Enter PAP code:

2. What kind of study does the PAP describe?
   *Mark only one oval.*
   - Field experiment
   - Lab experiment
   - Lab-in-field experiment
   - Natural experiment
   - Observational study
   - Other:

Hypotheses

3. Does the PAP specify a clear hypothesis (hypotheses) to be tested? A "clear hypothesis" is one that describes a relationship between a clearly identified independent and dependent variable in which the direction of the effect is specified.
   *Note: "providing citizens with information about service delivery will increase political participation" would be coded "yes"*
   *Mark only one oval.*
   - Yes
   - No

4. Does the PAP specify more than one hypothesis to be tested?
   *Mark only one oval.*
   - Yes
   - No

5. If yes, how many in total?

6. If the PAP specifies more than one hypothesis, are some of the hypotheses designated as primary and some as secondary/exploratory?
   *Mark only one oval.*
   - Yes
   - No
   - Not applicable (the PAP specifies just one hypothesis)
7. If the PAP distinguishes between primary and secondary/exploratory hypotheses, is this distinction maintained in the paper? (That is, are the primary hypotheses still presented as primary and the secondary hypotheses as secondary, or are some hypotheses that were pre-specified as secondary presented in the paper as primary, and vice versa?)

Mark only one oval.

☐ Yes
☐ No
☐ Not applicable (the PAP specifies just one hypothesis)

8. If the PAP specifies more than one hypothesis, how many are classified as primary?

9. How many of the primary hypotheses that were pre-registered in the PAP are presented in the main body of the paper?

10. How many of the primary hypotheses that were pre-registered in the PAP are presented in the appendix to the paper?

11. How many of the primary hypotheses that were pre-registered in the PAP and are presented in the main body of the paper are supported by the research findings?

12. How many of the primary hypotheses that were pre-registered in the PAP and are presented in the appendix are supported by the research findings?

13. How many of the secondary/exploratory hypotheses that were pre-registered in the PAP and are presented in the main body of the paper?

14. How many of the secondary/exploratory hypotheses that were pre-registered in the PAP and are presented in the appendix of the paper?
15. Are there any results highlighted in the paper based on entirely new hypotheses that were not mentioned in the PAP?

Mark only one oval.

☐ Yes
☐ No

16. If yes, do the researchers point out that these analyses were not pre-specified?

Mark only one oval.

☐ Yes
☐ No
☐ Not applicable (no results highlighted in the paper that were not based on pre-specified hypotheses)

Clarity of variable definitions

17. Is (are) the primary dependent variable(s) in the study operationalized sufficiently clearly so as to prevent post-hoc adjustments?

Note: Following Olken, "a good rule of thumb is that if you gave the PAP to two different programmers, and asked each to prepare the data for the primary dependent variable(s), they should be both able to do so without asking any questions, and they should both be able to get the same answer." If multiple primary DVs are specified, code based on whether, in general, they are operationalized clearly. Where some dependent variables are designated as primary, focus only on those.

Mark only one oval.

☐ Yes
☐ No

18. Are there any results highlighted in the paper that are based on changes in the operationalization of the primary dependent variable(s) that were pre-specified in the PAP?

Mark only one oval.

☐ Yes, significant changes that might plausibly affect estimates
☐ Yes, minor changes that probably do not affect estimates
☐ No changes in variable operationalization

19. If there are changes in the operationalization of the primary dependent variable(s), do the authors note that they are different from what was pre-specified?

Mark only one oval.

☐ Yes
☐ No
☐ Not applicable (no changes in variable operationalization)

20. Briefly describe these deviations from the PAP with respect to the operationalization of the primary dependent variable(s)

________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
________________________________________________________________________
21. If secondary/exploratory dependent variables are specified, are they operationalized sufficiently clearly so as to prevent post-hoc adjustments?

Note: Following Olken, "a good rule of thumb is that if you gave the PAP to two different programmers, and asked each to prepare the data for the secondary/exploratory dependent variable(s), they should be both able to do so without asking any questions, and they should both be able to get the same answer."

Mark only one oval.

☐ Yes
☐ No
☐ Not Applicable (secondary/exploratory DVs are not specified in the PAP)

22. Is the treatment or main explanatory variable specified sufficiently clear so as to prevent post-hoc adjustments?

Following Olken, "a good rule of thumb is that if you gave the PAP to two different programmers, and asked each to prepare the data for the treatment/main explanatory variable, they should be both able to do so without asking any questions, and they should both be able to get the same answer."

Mark only one oval.

☐ Yes
☐ No

23. Are there any results highlighted in the paper that are based on changes in the operationalization of the treatment or main explanatory variable that were pre-specified in the PAP?

Mark only one oval.

☐ Yes, significant changes that might plausibly affect estimates
☐ Yes, minor changes that probably do not affect estimates
☐ No changes in variable operationalization

24. If there are changes in the operationalization of the treatment or main explanatory variable, do the authors note that they are different from what was pre-specified?

Mark only one oval.

☐ Yes
☐ No
☐ Not applicable (no changes in variable operationalization)

25. Briefly describe these deviations from the PAP with respect to the operationalization of the treatment or main explanatory variable

_________________________________________________________________
_________________________________________________________________
_________________________________________________________________
_________________________________________________________________

26. How many control or other independent variables are pre-specified?
27. How many of these control or independent variables are specified sufficiently clear so as to prevent post-hoc adjustments?

Sampling and power analysis

28. Does the PAP specify the population of interest and unit of analysis?
   - [ ] Yes
   - [ ] No

29. Does the PAP specify the sampling frame?
   - [ ] Yes
   - [ ] No

30. Does the PAP specify the sampling strategy?
   - [ ] Yes
   - [ ] No

31. Does the PAP specify the conditions under which participants/units may be excluded from the sample?
   - [ ] Yes
   - [ ] No

32. Does the PAP use a power analysis to justify the sample size required for the study?
   - [ ] Yes
   - [ ] No

Data collection

33. Is the treatment/main independent variable under the control of (randomized by) the researchers?
   - [ ] Yes
   - [ ] No

34. If yes, does the PAP specify how participants/units will be assigned to treatment (i.e., the randomization procedure)?
   - [ ] Yes
   - [ ] No
   - [ ] Not Applicable (treatment is not controlled by researcher)
35. Does the PAP specify a manipulation check (i.e. variables to report in a balance table)?

   Mark only one oval.
   ☐ Yes
   ☐ No

36. If yes, does the PAP specify what to do in the event of an imbalance?

   Mark only one oval.
   ☐ Yes
   ☐ No
   ☐ Not Applicable (PAP does not specify a manipulation check)

**Inclusion and exclusion rules**

37. Does the PAP specify rules on how to handle missing values and attrition?

   Mark only one oval.
   ☐ Yes
   ☐ No

38. Does the paper follow the pre-specified protocols with respect to missing values and attrition?

   Mark only one oval.
   ☐ Yes
   ☐ No
   ☐ Not applicable

39. Does the PAP specify rules for dealing with outliers?

   Mark only one oval.
   ☐ Yes
   ☐ No

40. Does the paper follow the pre-specified protocols with respect to dealing with outliers?

   Mark only one oval.
   ☐ Yes
   ☐ No
   ☐ Not applicable

41. Does the PAP specify rules for dealing with noncompliance?

   Mark only one oval.
   ☐ Yes
   ☐ No
   ☐ Not applicable (noncompliance is not an issue in the study)
42. Does the paper follow the pre-specified protocols with respect to noncompliance?
   *Mark only one oval.*
   - Yes
   - No
   - Not applicable

### Statistical model specification

43. Does the PAP spell out the precise statistical model to be tested including functional forms and estimator (ordinary least squares, probit, logit, Poisson, instrumental variables, and so on)?
   *Mark only one oval.*
   - Yes
   - No

44. Are the results presented in the paper based on the exact model specifications that were pre-specified?
   *Mark only one oval.*
   - Yes
   - No, minor deviations from pre-registered specifications that probably do not affect estimates
   - No, minor deviations from pre-registered specifications that might plausibly affect estimates
   - No, major deviations from pre-registered specifications

45. If there are deviations from the pre-registered model specifications, do the authors point out that the specifications they use are different from what was pre-registered?
   *Mark only one oval.*
   - Yes
   - No

46. Briefly describe these deviations from the PAP with respect to model specifications.

__________________________________________________________________________
__________________________________________________________________________
__________________________________________________________________________
__________________________________________________________________________

47. Does the PAP state how standard errors will be treated (robust, clustering, bootstrapping, or other techniques)?
   *Mark only one oval.*
   - Yes
   - No
48. Does the PAP specify a multiple testing adjustment?
   Mark only one oval.
   - Yes
   - No
   - Not Applicable (too few DVs for a multiple testing adjustment to be necessary)

49. Does the PAP commit the researchers to presenting a simple difference-in-means test?
   Mark only one oval.
   - Yes
   - No

50. If yes, do the authors specify whether the test will be one-tailed or two-tailed?
   Mark only one oval.
   - Yes
   - No
   - Not applicable (no difference-in-means test is specified)

51. Does the PAP specify whether/how covariates (including fixed effects) will be included in the regression model?
   Mark only one oval.
   - Yes
   - No

Other features

52. When was the PAP initially registered?
   Mark only one oval.
   - Prior to data collection
   - After data collection but before authors had access to/analyzed data
   - After analysis of data had begun
   - Other: __________________________________________

53. Was the PAP ever gated/private?
   Mark only one oval.
   - Yes
   - No

54. Was the PAP ever updated/refiled?
   Mark only one oval.
   - Yes
   - No
55. If the PAP was updated/refiled, how many updates were registered?
   *Mark only one oval.*
   - One
   - Two
   - Three or more
   - Not applicable (PAP never updated)

56. If the PAP was updated/refiled, were the updates clearly identified as changes from the original PAP?
   *Mark only one oval.*
   - Yes
   - No
   - Not Applicable (PAP never updated)

57. Does the PAP specify that the study has received IRB approval (or that such approval is pending)?
   *Mark only one oval.*
   - Yes
   - No
   - Not Applicable (IRB approval is not necessary for a study of this type)

58. Do authors pre-specify what will guide their decisions when issues arise that were not anticipated in the PAP (i.e., the SOPs described in Lin and Green 2015)?
   *Mark only one oval.*
   - Yes
   - No

59. How many pages long is the PAP (in single-spaced pages)?
   Note: Divide double-spaced documents by two.

60. Do the authors provide a link to their replication data in the paper?
   Note: Divide double-spaced documents by two.
   *Mark only one oval.*
   - Yes, a link is provided and it works
   - Yes, a link is provided but it does not work
   - Authors indicate that the replication data is "available on request"
   - No mention of replication data

61. Do the authors provide a link to their do files in the paper?
   Note: Divide double-spaced documents by two.
   *Mark only one oval.*
   - Yes, a link is provided and it works
   - Yes, a link is provided but it does not work
   - Authors indicate that the do files are "available on request"
   - No mention of the do files
62. **Do the authors make available their data collection instruments and/or lab protocols?**

   Note: Divide double-spaced documents by two.  
   *Mark only one oval.*

   ☐ Yes, they are provided in an appendix (including an online appendix)
   ☐ Authors indicate that these materials are "available on request"
   ☐ No mention is made of these materials
C  PAP users’ survey
Pre-analysis plans survey

Survey Flow

Standard: Introduction (1 Question)
Block: Pre-registration practice (13 Questions)
Standard: PAPs in the paper writing process (4 Questions)
Standard: PAPs in the review process (6 Questions)
Standard: Open-ended questions (5 Questions)
We thank you for your participation. The survey will take only 5-10 minutes to complete. Please, feel free to skip any questions that you prefer not to answer.

Q2.1 Have you ever registered a pre-analysis plan (PAP) for a research project?

- Yes (1)
- No (2)

**Display This Question:**
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes

Q32 How many PAPs have you registered?

- 1-2 (1)
- 3-4 (2)
- 5 or more (3)

**Display This Question:**
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes

Q2.2 Have you ever kept one or more of your PAPs gated/private for a period of time?

- Yes (1)
- No (2)
Q2.3 Do you have any ongoing research projects for which you did not register a PAP?

- Yes (1)
- No (2)

Q2.4 How many?

- 1-2 (1)
- 3-4 (2)
- 5 or more (3)

Q2.5 In contemplating registering a PAP, did you have any concern that others might scoop your ideas?

- No concern whatsoever (1)
- Slight concern (2)
- Significant concern (3)
- The PAP was gated (4)
Q2.6 How long does it take you to draft a PAP for a typical project?

- A few days (1)
- About a week (2)
- 2-4 weeks (3)
- More than a month (4)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project?  = Yes

Q2.7 Did writing the PAP cause you to discover anything about your project that led to refinements in your research protocols and/or data analysis plans?

- Yes (1)
- No (2)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project?  = Yes

Q2.8 Did writing the PAP put you in a position to receive useful feedback on your project design that you might not otherwise have received?

- Yes (1)
- No (2)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project?  = Yes
Q2.9 Did writing the PAP delay the implementation of your project?

- Yes (1)
- No (2)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes

Q2.10 Did you experience any downstream time savings from having written a PAP?

- Yes (1)
- No (2)

Display This Question:
If Did you experience any downstream time savings from having written a PAP? = Yes

Q2.11 Were these downstream time savings greater than the time spent to draft the PAP in the first place?

- Yes (1)
- No (2)
- About equal (3)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes
Q2.12 Which of the following best characterizes your feelings about the time it takes to write and register a PAP?

- It doesn’t take much time, so the cost is low. (1)
- It takes a considerable amount of time, but it is worth it. (2)
- It takes a considerable amount of time, and I am not certain of the value in the end. (3)

End of Block: Pre-registration practice

Start of Block: PAPs in the paper writing process

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes

Q3.1 To what extent do you think the existence of a PAP restricted your ability to fully explore and analyze your data?

- Not at all (1)
- Somewhat (2)
- Quite a bit (3)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes

Q3.2 To what extent do you think the existence of a PAP made it more difficult to write a theoretically interesting paper?

- Not at all (1)
- Somewhat (2)
- Quite a bit (3)

Display This Question:
If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes
Q3.3 To what extent do you think the existence of a PAP prevented you from stumbling on unexpected, surprise results?

☐ Not at all (1)

☐ Somewhat (2)

☐ Quite a bit (3)

☐ Don’t know (4)

Q3.4 Have you ever consulted a registry (EGAP, AEA) to learn whether studies on a particular research topic have ever been initiated?

☐ Yes (1)

☐ No (2)

End of Block: PAPs in the paper writing process

Start of Block: PAPs in the review process

Display This Question:

If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes

Q4.1 Have you ever included a PAP with a paper you have submitted to a journal?

☐ Yes (1)

☐ No (2)

☐ No, but the paper mentions the PAP and I have assumed that reviewers could easily find it (3)

Display This Question:

If Have you ever registered a pre-analysis plan (PAP) for a research project? = Yes
Q4.2 When you have submitted a pre-registered paper for publication, have reviewers ever mentioned your PAP?

☐ Yes (1)

☐ No (2)

Display This Question:

If When you have submitted a pre-registered paper for publication, have reviewers ever mentioned you... = Yes

Q4.3 Did they (please choose all that apply):

☐ compare pre-specified hypotheses with those presented in the main paper? (1)

☐ compare pre-specified variable definitions with those presented in the main paper? (2)

☐ compare pre-specified inclusion of control variables with those presented in the main paper? (3)

☐ refer to the PAP for some other reason (Please specify) (4)
